SAFECYBER

Mini SIEM Front-End

PROJECT GUIDE / UPDATED OCTOBER 2026

A practical guide to the SafeCyber security operations prototype: its pages, interactive workflows, implementation structure, and demo-only boundaries.

PROJECT AT A GLANCE

What it demonstrates

An admin dashboard with security views, searchable logs, sample alerts, IP controls, and a responsive operator profile.

How it is built

Semantic HTML, shared CSS, and vanilla JavaScript. The app runs as static browser files without a package build.

Prototype boundary

This is a visual and interaction demo, not a live SIEM. Authentication, data, and profile values are illustrative and browser-controlled.

Project structure

The primary experience is a protected single-page admin console. Supporting sign-in and access pages remain separate documents; standalone logs, alerts, and blocked-IP pages are retained for compatibility.

- **index.html + app.js**
  Dashboard shell, role guard, in-app view navigation, global search, activity simulation, event timeline, chart, and operator profile.
- **styles.css**
  Shared dark glass design system, responsive dashboard/auth styles, chart tooltip, and profile controls.
- **login.html + JS/main.js**
  Demo sign-in, gate-to-form transition, session role setup, logout handling, and legacy page interactions.
- **register.html + no-access.html**
  Registration-style request screen (no account creation) and the restricted regular-user landing page.
- **CSS/style.css**
  Compatibility stylesheet that imports the project-root styles.css for the retained pages.

CURRENT ROUTES

login.html	SafeCyber login gate and demo sign-in form.
index.html	Admin console: Dashboard, Vulnerabilities, Incidents, Compliance, Settings, Authentication logs, Security alerts, Blocked IPs, Operator profile.
register.html	Registration-style screen; submit explains registration is not connected.
no-access.html	Authenticated regular demo user landing page.
Retained standalone pages	Retained standalone demo pages; Overview links return to index.html.

Dashboard & analyst workflows

The dashboard combines a threat overview with dedicated in-app views for common analyst tasks. Navigation updates the visible view without a page reload.

- **Overview and threat tracking**
  KPI summaries, threat table filters (All / Open / Resolved), priority filtering, and resolve actions for demo findings.
- **Incident timeline**
  Chronological sample events with periodic low-impact demo entries while live activity simulation is enabled.
- **Authentication activity chart**
  Twelve illustrative hourly buckets. Hover or keyboard-focus a bucket to inspect UTC interval, event counts, rate estimate, anomaly, and illustrative MITRE ATT&CK mapping.
- **Authentication logs and alerts**
  Searchable sample tables. Alert resolve actions update the current page and provide visible feedback.
- **Blocked IP management**
  The local dialog checks IPv4 formatting, duplicate entries, and a required reason. Add and unblock actions update only the displayed DOM.
- **Operator profile**
  Shows the signed-in demo name, clearance, sample session details, and masked placeholder tokens with reveal/remask controls.

Live clock

Dashboard view headers display a UTC timestamp updated once per second. Clock updates are local browser time converted to UTC; they are not synchronized with a backend.

Chart interpretation

The chart and MITRE labels are handcrafted illustrative data. The displayed events-per-second figure is an estimate from each sample hourly count, not a measured ingestion pipeline.

Sign-in, registration & data boundaries

The SafeCyber screens demonstrate an analyst-facing experience. They do not implement production authentication or connect to a live security service.

- **Login gate**
  A centered eye-and-tracking-data logo introduces the sign-in flow. Continue to sign in transitions to the form, which accepts the documented demo accounts.
- **Demo roles**
  Administrator: admin / 123. Regular user: saliem / saliem123. These public values exist in client-side JavaScript and are not secrets.
- **Session behavior**
  The browser tab stores the demo role, username, and login timestamp in sessionStorage. Admin-only routing is enforced in front-end code and can be bypassed.
- **Registration**
  The form uses native input checks but does not create or persist accounts. It displays a clear demo limitation after submission.
- **Masked profile values**
  Reveal controls only change local display text. The password is not stored; token strings are invalid demo placeholders. The shown remote IP is illustrative.

> **Never use with real credentials**
> Client-side checks, sessionStorage, sample secrets, and DOM-only actions do not protect sensitive data. Do not enter real credentials or deploy this prototype as an access-control system.

PRODUCTION ROADMAP

- **Server-side identity**
  Use a maintained identity provider or secure backend, password hashing, protected session cookies, and account lifecycle controls.
- **Authorization and audit**
  Enforce roles at protected server endpoints; record administrative actions server-side and provide auditable error handling.
- **Real SIEM data**
  Replace static records with validated API responses, durable event storage, ingestion monitoring, and deployment-specific operations.

Design system & responsive behavior

SafeCyber uses a near-black canvas, a fixed blue ambient glow, translucent glass surfaces, cool-blue tracking accents, and high-contrast security states.

- **Shared visual language**
  Glass panels, rounded cards, dark capsule inputs, blue focus rings, status badges, and a custom vector eye/tracking-data mark.
- **Responsive layout**
  The dashboard sidebar becomes a slide-in menu on narrow screens. Tables remain horizontally scrollable, cards reflow, and login/registration screens adapt to mobile.
- **Accessibility considerations**
  Semantic headings and forms, associated labels, keyboard-operable buttons, live feedback regions, focus styles, and reduced-motion accommodations.

OPEN THE DEMO

- **Start at login.html**
  Open the local file in a modern browser. No package installation or compilation is needed.
- **Explore admin features**
  Sign in with admin / 123, then try view navigation, filters, searches, alert resolution, the IP dialog, timeline tooltips, and profile reveal/remask.
- **Explore restricted access**
  Sign in with saliem / saliem123 to view the regular-user access page. Registration is a non-persistent UI demo.

> **Implementation map**
> Primary app: index.html + app.js + styles.css. Authentication and retained standalone page behavior: JS/main.js. Shared stylesheet compatibility path: CSS/style.css.

VERIFICATION NOTES

JavaScript syntax was checked with Node.js. Browser interaction checks covered login-stage transition, dashboard navigation, live UTC headers, chart tooltip details, and profile token reveal/remask. No automated test files were present in the project.
